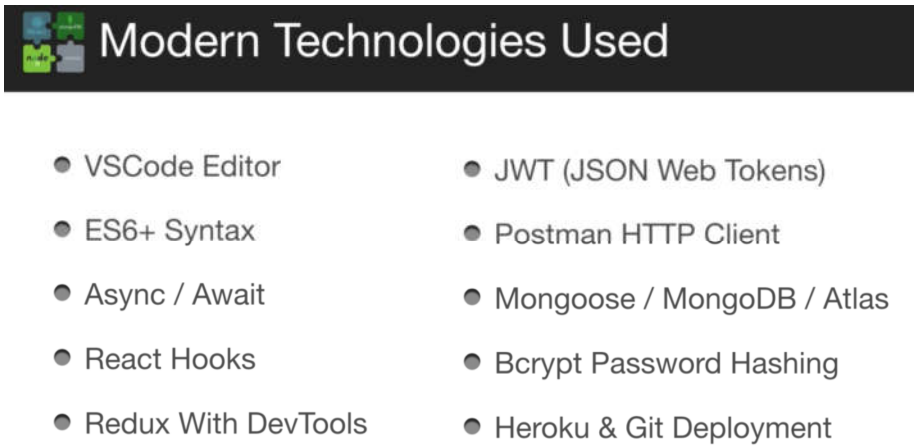
MERN STACK SOCIAL NETWORK

Table of contents

1. Introduction



NodeJS, VSCode (with bracket pair colorizer, prettier, ES7 React/Redux/GQL snippets), git (git-scm.com), Postman, React DevTools and Redux DevTool (Google chrome extensions).

2. Express & MongoDB Setup

VSCode:
CLI=> touch .gitignore
(this commad will create a .gitignore file)
Write to .gitignore node_modules/
(this command will add all the files from node_modules folder to ignore list – git will not upload/download all these files)

0. How to create a new project? (in point of Node Package Manager - npm)

CLI=> npm init

1. How to install all the dependencies to project?

CLI=> npm install express express-validator bcryptjs config gravatar jsonwebtoken mongoose request

2. How to install DEV dependencies to project?

CLI=> npm install -D nodemon concurrently

3. Create a MAIN file (entry point – server.js) with a test route

server.js

```
//Import EXPRESS
const express = require('express');
//Create a back-end server - APP
const app = express();
//Set up a port for server
const PORT = process.env.PORT || 5000;
//Set up a server to listen a port. Log to console string with information about port
app.listen(PORT, () => console.log(`Server is started on port ${PORT}`));
//Set up 1st test route: GET, to root folder, response will be aq string with a mesage
app.get('/', (req, res) => res.send('API running ...'));
```

4. Set up scripts to start a server

file package.json=>

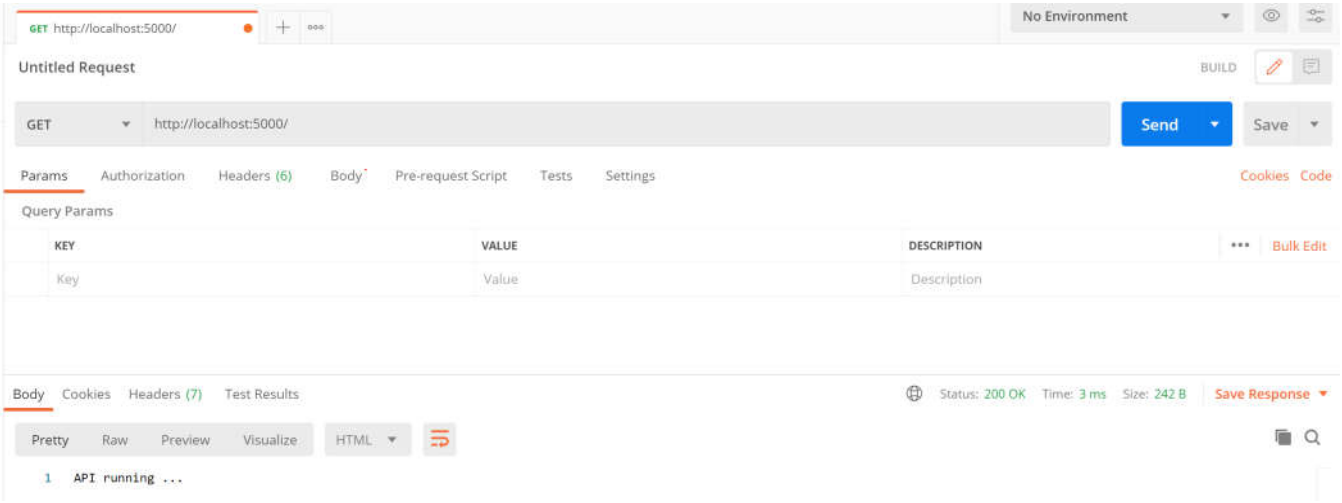
server.js | package.json

```
{
  "name": "devconnector",
  "version": "1.0.0",
  "description": "Social network",
  "main": "server.js",
  Debug
  "scripts": {
    "start": "node server",
    "server": "nodemon server"
  },
  "author": "",
  "license": "ISC",
  "dependencies": {
    "bcryptjs": "^2.4.3",
    "config": "^3.3.3",
    "express": "^4.17.1",
    "express-validator": "^6.9.2",
    "gravatar": "^1.8.1",
    "jsonwebtoken": "^8.5.1",
    "mongoose": "^5.11.17",
```

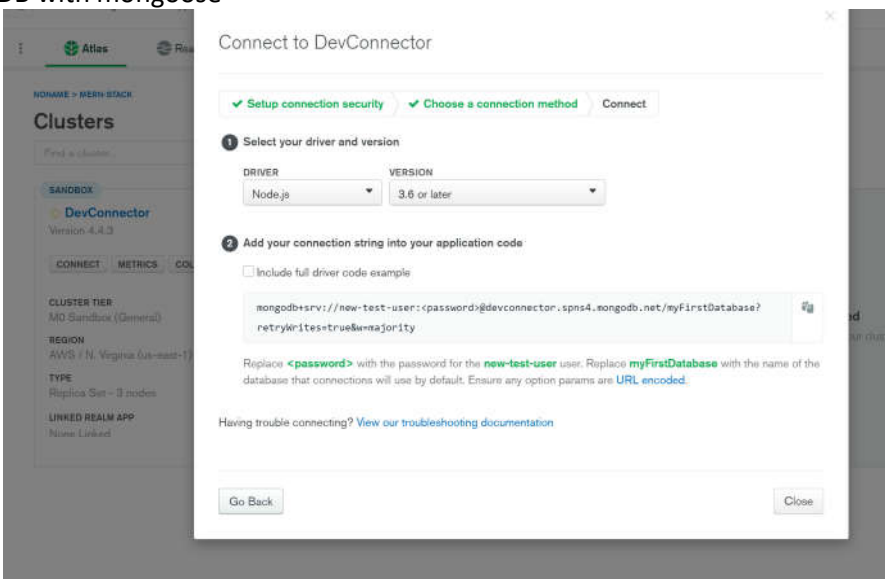
5. How to start a server?

CLI=> npm run server

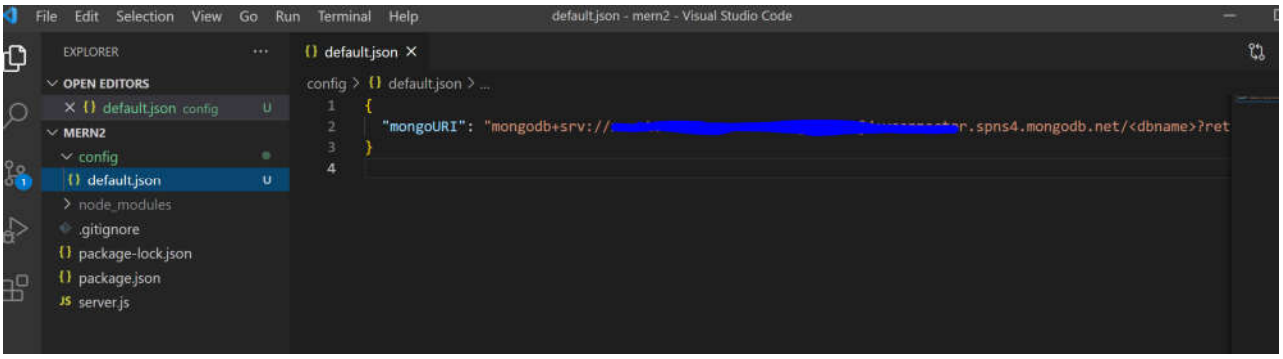
6. Check a test route with a Postman:



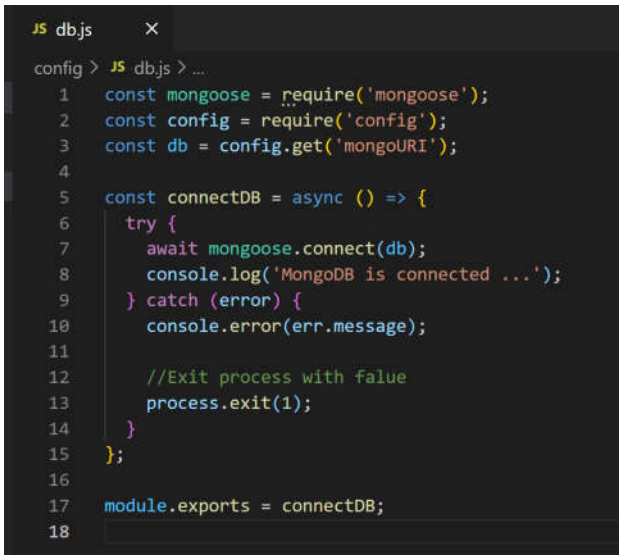
2.3 Connecting to MongoDB with mongoose



1. Create a folder – config
CLI=> mkdir config
CLI=> cd config
CLI=> touch default.json



2. Create a file db.js



server.js

```
//Import EXPRESS
const express = require('express');
//Import a function to connect to DB
const connectDB = require('./config/db.js');
//Create a back-end server - APP
const app = express();
//Calling a function to connect to DB
connectDB();
//Set up a port for server
const PORT = process.env.PORT || 5000;
//Set up a server to listen a port. Log to console string with information about port
app.listen(PORT, () => console.log(`Server is started on port ${PORT}`));
//Set up 1st test route: GET, to root folder, response will be aq string with a mesage
app.get('/', (req, res) => res.send('API running ...'));
```

db.js

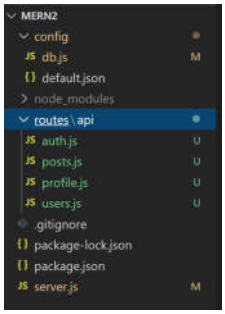
```
const mongoose = require('mongoose');
const config = require('config');
const db = config.get('mongoURI');
const connectDB = async () => {
  try {
    await mongoose.connect(db, {
      useNewUrlParser: true,
      useUnifiedTopology: true,
    });
    console.log('MongoDB is connected ...');
  } catch (error) {
    console.error(err.message);
    //Exit process with falue
    process.exit(1);
  }
};
module.exports = connectDB;
```

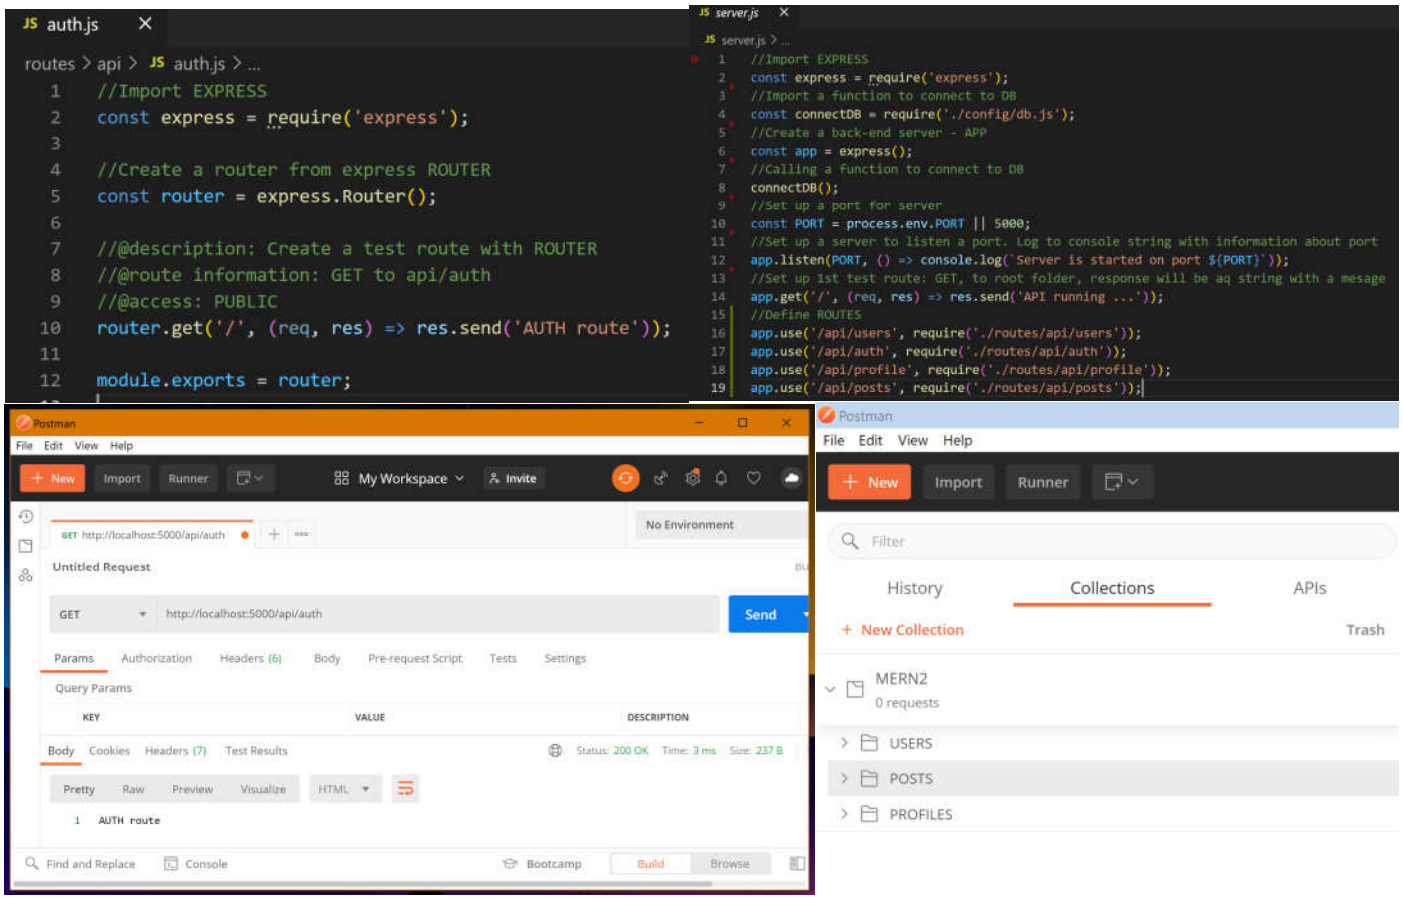
```
stslon@DESKTOP-06BF17J MINGW64 /f/_React/_files/mern2 (master)
$ npm run server

> devconnector@1.0.0 server F:\_!_files\mern2
> nodemon server

[nodemon] 2.0.7
[nodemon] to restart at any time, enter `rs`
[nodemon] watching path(s): *.*
[nodemon] watching extensions: js,mjs,json
[nodemon] starting `node server.js`
(node:9068) Warning: Accessing non-existent property 'MongoError' of
 dependency
(Use `node --trace-warnings ...` to show where the warning was creat
Server is started on port 5000
(node:9068) DeprecationWarning: Listening to events on the Db class
 removed in the next major version.
MongoDB is connected ...
```

3. Create a folder for store all the routes – routes/api – with next files: users.js, auth.js, profile.js, posts.js





auth.js
routes > api > auth.js > ...
//Import EXPRESS
const express = require('express');
//Create a router from express ROUTER
const router = express.Router();
//@description: Create a test route with ROUTER
//@route information: GET to api/auth
//@access: PUBLIC
router.get('/', (req, res) => res.send('AUTH route'));
module.exports = router;
server.js
//Import EXPRESS
const express = require('express');
//Import a function to connect to DB
const connectDB = require('./config/db.js');
//Create a back-end server - APP
const app = express();
//Calling a function to connect to DB
connectDB();
//Set up a port for server
const PORT = process.env.PORT || 5000;
//Set up a server to listen a port. Log to console string with information about port
app.listen(PORT, () => console.log(`Server is started on port ${PORT}`));
//Set up 1st test route: GET, to root folder, response will be aq string with a mesage
app.get('/', (req, res) => res.send('API running ...'));
//Define ROUTES
app.use('/api/users', require('./routes/api/users'));
app.use('/api/auth', require('./routes/api/auth'));
app.use('/api/profile', require('./routes/api/profile'));
app.use('/api/posts', require('./routes/api/posts'));

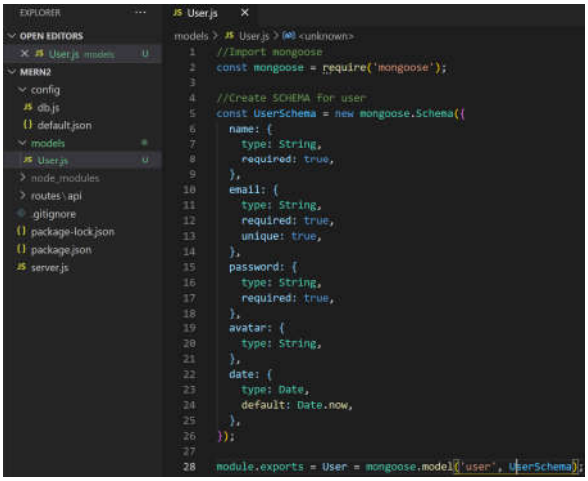
3. User API Routes & JWT Authentication

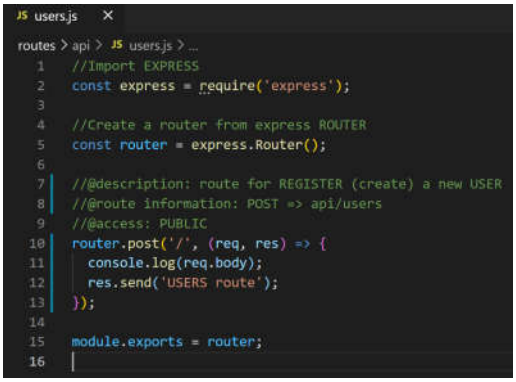
3.1 Creating The User Model (with schema for database)

3.1.1 Create a folder MODELS and inside it a file User.js

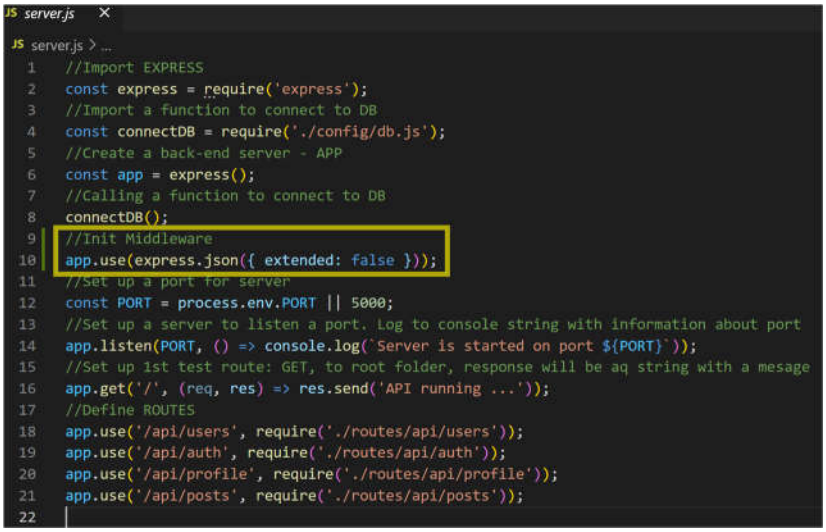


3.2 Request & Body Validation

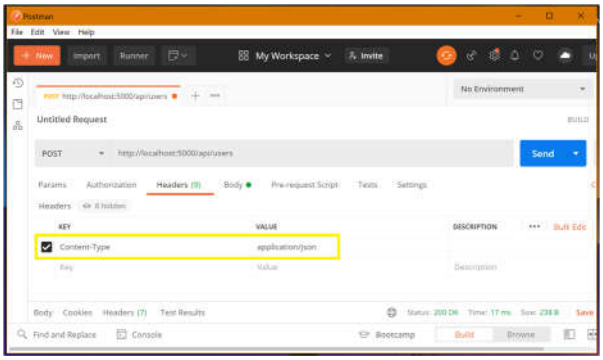
3.2.1 Make some changes at route users.js

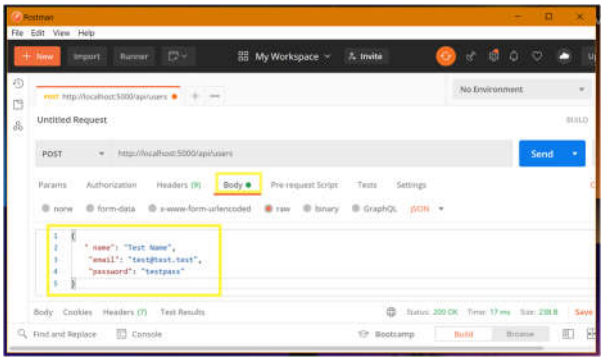


3.2.2 Init Middleware function at server.js (to be able work with bodypharser)



3.2.3 Make some changes at Postman for work with requests





```
[nodemon] 2.0.7
[nodemon] to restart at any time, enter `rs`
[nodemon] watching path(s): *.*
[nodemon] watching extensions: js,mjs,json
[nodemon] starting `node server.js`
(node:12624) Warning: Accessing non-existent property 'MongoError' of mod
(Use `node --trace-warnings ...` to show where the warning was created)
Server is started on port 5000
(node:12624) DeprecationWarning: Listening to events on the Db class has
MongoDB is connected ...
{ ' name': 'Test Name', email: 'test@test.test', password: 'testpass' }
```

3.2.4 Validation data from request with express-validator

Import *check* and *validationResult* to route users.js from express-validator/check

```
routes > api > JS users.js > ...
1   //Import EXPRESS
2   const express = require('express');
3
4   //Create a router from express ROUTER
5   const router = express.Router();
6
7   //Import check and validationResult
8   const { check, validationResult } = require('express-validator/check');
9
10  //@description: route for REGISTER (create) a new USER
11  //@route information: POST => api/users
12  //@access: PUBLIC
13  router.post('/', (req, res) => {
14    console.log(req.body);
15    res.send('USERS route');
16  });
17
18  module.exports = router;
```

Add checking at users.js ()

```
routes > api > users.js > router.post('/') callback
1  //Import EXPRESS
2  const express = require('express');
3  //Create a router from express ROUTER
4  const router = express.Router();
5  //Import check and validationResult
6  const { check, validationResult } = require('express-validator/check');
7  //@description: route for REGISTER (create) a new USER
8  //@route information: POST => api/users
9  //@access: PUBLIC
10 router.post(
11   '/',
12   [
13     check('name', 'Please check name and try again')
14       .isLength({
15         min: 6,
16       })
17       .isString(),
18     check('email', 'Please check email and try again').isEmail(),
19     check('password', 'Please check password and try again').isLength({
20       min: 6,
21     }),
22   ],
23   (req, res) => {
24     const errors = validationResult(req);
25     if (!errors.isEmpty()) {
26       return res.status(400).json({ errors: errors.array() });
27     }
28     res.send('USERS route');
29   }
30 );
31 module.exports = router;
```

POST http://localhost:5000/api/users

Untitled Request

POST http://localhost:5000/api/users

```
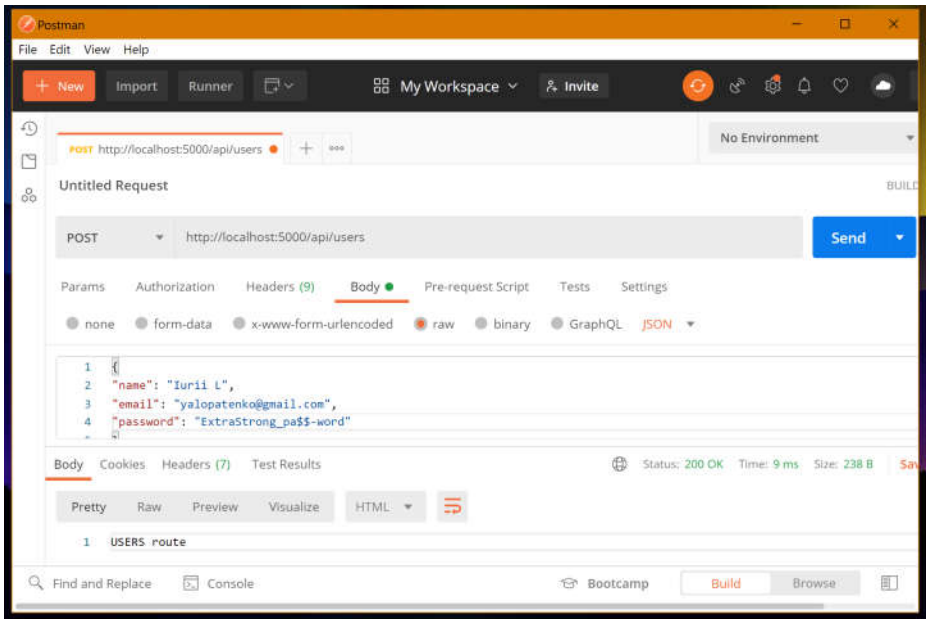
{
    "errors": [
        {
            "msg": "Please check name and try again",
            "param": "name",
            "location": "body"
        },
        {
            "msg": "Please check name and try again",
            "param": "name",
            "location": "body"
        },
        {
            "msg": "Please check email and try again",
            "param": "email",
            "location": "body"
        },
        {
            "msg": "Please check password and try again",
            "param": "password",
            "location": "body"
        }
    ]
}
```



3.3 User REGISTRATION

3.3.1 Add all the logic to route users.js

```
routes > api > JS users.js > ...
16   //import check and validationResult
17   const { check, validationResult } = require('express-validator');
18
19   //@description: route for REGISTER (create) a new USER
20   //@route information: POST => api/users
21   //@access: PUBLIC
22   router.post('/',[
23       check('name', 'Please check name and try again').isLength({ min: 6 }).isString(),
24       check('email', 'Please check email and try again').isEmail(),
25       check('password', 'Please check password and try again').isLength({ min: 6,}),],
26     async (req, res) => {
27       const errors = validationResult(req);
28       if (!errors.isEmpty()) {
29         return res.status(400).json({ errors: errors.array() });
30       }
31       const { name, email, password } = req.body;
32       try {
33         //Check if in database exists a user with the same email (email should be unique)
34         let user = await User.findOne({ email });
35         if (user) {
36           return res.status(400).json({ errors: [{ msg: 'User already exists' }] });
37         }
38         //Get users gravatar
39         const avatar = gravatar.url(email, { s: '200', r: 'pg', d: 'mm' });
40         //CREATE a new USER
41         user = new User({ name, email, avatar, password });
42         //Encrypt password with bcrypt
43         //1. Create a salt
44         const salt = await bcrypt.genSalt(10);
45         //2. Change a password to a hash
46         user.password = await bcrypt.hash(password, salt);
47         //SAVE a new USER
48         await user.save();
49         //Return jsonwebtoken - TODO!!!
50         res.send('USER is REGISTERED');
51       } catch (err) {
52         console.error(err.message);
53         res.status(500).send('Server ERROR !!!');
54       }
55     }
56   );
57   module.exports = router;
```
